Disk Space Cleanup Utility is relatively straightforward and it will help you clean up your hard drive. The application runs in batch mode, so there is no need to be worried about its security, it is extremely safe. Not all of the changes are useful though, as Disk Space Cleanup Utility scans for files with the size of less than 2 KB, and removes them from your computer. However, I would still strongly suggest to apply it. However, you should be aware of the changes that will be applied. They will not cause any issues, but it might alter some of your program settings and other features. These changes can be reversed and resaved. Users who run Disk Space Cleanup Utility should be aware of the changes that are applied. They are usually easy to reverse, but sometimes it might lead to data loss. Disk Space Cleanup Utility (sometimes abbreviated as DISKCACHE) is a free disk cleanup utility, which enables you to clean up temporary files and the so-called system files, which are not used by Windows itself, but are helpful to various applications and add ons. Disk Space Cleanup Utility can be used to optimize the performance of Windows, and it can also be used to free up as much disk space as possible. There are two ways of using Disk Space Cleanup Utility: either you run it as administrator (in this case, the application will apply all changes even if it is not asked), or you run it as a standard user (it will ask you whether or not to run the changes). Most of the settings can be adjusted afterwards, you just have to open the Advanced tab in the Settings section of the application, and then the tabs for the various functions, such as Clean Cache and Clean System Files. The settings that allow you to reduce storage space include: Disabling the hibernation feature. Setting the volume swap file to maximum 1 GB (maximum of 2 GB in Windows 10). Removing network icons and Quick Launch bar Deleting unused services Deleting the Page file Cleaning the Windows Updates Cache Reorganizing the Windows' file system.
